The Wheeler Dealers

Vehicle Inspection Module
Business & Functional Requirements

Purpose

The Vehicle Inspection module enables customers to book professional mobile vehicle inspections, inspectors to perform digital inspections, and administrators to manage the complete workflow. The platform is designed for future AI integration.

Users

1. Customer
2. Inspector
3. Admin

Customer - Landing Page

Sales page promoting inspection services with CTAs, benefits, inspection coverage, transparent pricing, and future AI features.

Customer - Booking Wizard

Six-step flow: Customer Details, Vehicle Details (VIN decode), Location, Date & Time, Review, Confirmation. Generate Job ID and send SMS/Email/WhatsApp confirmations.

Inspector Login

Secure authentication with email/password.

Inspector Dashboard

Shows open jobs, today's jobs, completed jobs, performance metrics, navigation and customer contact shortcuts.

Job Details

Displays vehicle, customer, map, appointment, and Start Inspection button.

Inspection Form

Digital inspection with Exterior, Interior, Mechanical, Electrical, Road Test, Tyres, Underbody, Photos and Summary. Every inspection point supports condition, comments, and photos. Include autosave and offline mode.

Review & Submit

Review completion, preview photos, add comments, generate and send report. Future AI writes summary and repair recommendations.

Admin Dashboard

Manage bookings, jobs, inspectors, customers, reports, revenue, analytics and settings.

Jobs Management

Assign/reassign inspectors, monitor status, export reports, search and filter jobs.

Workflow

Customer books → Admin assigns → Inspector performs inspection → Report generated → Customer receives report → Job closed.

Future AI Roadmap

VIN decoding, AI damage detection, OCR VIN/Odometer, voice-to-text, paint analysis, repair cost estimation, vehicle condition score, market value estimation, buyer recommendation.

Development Principles

Build modular architecture, unique IDs for inspection items, photo metadata, offline synchronization, API-first design for future AI integrations.
